AeraSense sensing technology accurately detects and quickly responds to even the slightest particle change in the air. It provides you with reassurance with real-time PM2.5 feedback.

Most of the indoor air pollutants fall under PM2.5 – which refers to airborne particle pollutants smaller than 2.5 micrometers. Common indoor sources of fine particles are tobacco smoke, cooking, burning candles. Some airborne bacteria and the smallest mold spores, pet allergen and dust mite allergen particles also fall under PM2.5.

# 7 Troubleshooting

This chapter summarizes the most common problems you could encounter with the appliance. If you are unable to solve the problem with the information below, contact the Consumer Care Center in your country.

Problem	Possible solution
The appliance does not work even though it is plugged in.	<ul> <li>The filter replacement light has been flashing but you have not replaced the NanoProtect filter, and the appliance is now locked. In this case, replace the filter and reset the filter lifetime counter.</li> <li>The water refill light flashes. Make sure the water tank is properly installed and there is enough water in the water tank.</li> </ul>
The appliance does not work even though it is switched on.	The appliance is working but the buttons are not responsive.  Check if the child lock is on.
There are some white deposits on the NanoCloud rotary humidification wick.	The white deposits are called scale and they consist of minerals from the water. Scale on the NanoCloud rotary humidification wick affects the humidifying performance, however it does not harm your health. Follow the cleaning instructions in the user manual.
No air comes out of the air outlet.	Plug the appliance into the power supply and switch on.
The airflow that comes out of the air outlet is significantly weaker than before.	<ul> <li>The pre-filter is dirty. Clean the pre-filter (see the chapter "Cleaning").</li> <li>Make sure that you have removed all packaging material of the NanoProtect filter.</li> </ul>

Problem	Possible solution
It takes a long time to reach the target humidity level.	NanoCloud technology evenly distributes invisible water vapour into your room. In dry conditions moisture from the humidifier will be absorbed by walls, furniture, and other items in your room. Ventilation of dry outside air will also increase the time it takes to reach the target humidity. To optimize humidification and purification performance, it's recommended to close doors and windows during use.
I do not see water vapor coming out of the appliance. Is it working?	When mist is very fine, it is invisible. The appliance has a NanoCloud humidification technology, which produces healthy humid air from the outlet area without formation of water mist. Therefore, you cannot see the mist.
The appliance produces a strange smell.	<ul> <li>The first few times you use the appliance, it may produce a plastic smell. This is normal. However, if the appliance produces a burnt smell even if removing filters, contact your Philips dealer or an authorized Philips service center.</li> <li>The filter may produce smell after being used for a while because of the absorption of indoor air. Remove the filter and place it where it has direct sunlight and ventilation for several hours. Re-install and try using it again. If the odor remains, please replace the filter.</li> </ul>
The appliance is extra loud.	You have not removed all packaging material of the filters.     Make sure that you have removed all packaging material.     Change the fan speed to lower fan speed level.
The appliance still indicates that I need to replace a filter, but I already did.	Perhaps you did not touch and hold the Timer/Reset button Correctly. Plug in the appliance, touch to switch on the appliance, and touch and hold the Timer/Reset button for 3 seconds.
Error codes "E1", "E2", "E3", "E4" or "E5" displays on the screen.	The appliance has malfunctions. Contact the Consumer Care Center in your country.
